EquiLoop™ by WellCheck

Community-Integrated Care Coordination
Connecting people, providers, and communities to better health.

Tribal Communities

EquiLoop meets programs where they are

Where a Tribe already runs RPMS with RCIS and PRC, EquiLoop works as the community front door, the access layer that sits ahead of the formal referral process without changing it. Where the referral process is manual or varies by program, EquiLoop adds referral tracking and PRC documentation that stays with the case. In both cases, the constant is coordination across programs that share clients but not a shared intake path.

Helping People Find Services and Request Them

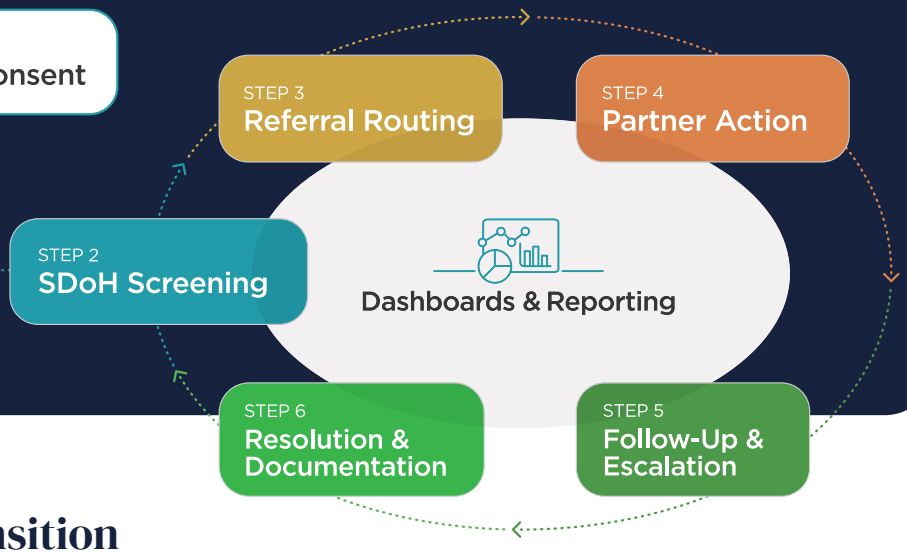

Tribal communities are served by programs that share the same people but rarely share a way in. EquiLoop helps people find services, request them, and get routed to the right program before a formal referral ever starts.

The EquiLoop Process

Proven in Deployment

93.9% Closed-loop completion rate
22,682 Individuals screened
45,458 Services delivered
32 Partner organizations engaged

Rural health hub deployment with a multi-partner ecosystem. Includes both clinical and social services referrals.

Steady across systems, and through the EHR transition

IHS has also begun moving to a new record system, PATH EHR, built on Oracle Health, starting with an initial pilot and cohort rollouts to follow. Because EquiLoop sits above the record rather than inside it, it works across that mix and stays stable while the systems beneath it change. Migrations are periods when integrations are in flux. A coordination layer that sits above the record keeps intake, routing, and follow-up continuous while that work happens underneath.

The Front Door

- **Public-facing service directory.** One searchable directory of programs and services across the Nation, clinical and non-clinical, so community members and staff see the same source of truth.
- **Self-referral and service requests.** Community members request services directly, and staff submit on their behalf, from any web-enabled device, with no app to download.
- **Pre-screening and eligibility.** Configurable screening and eligibility questions up front, so programs receive complete requests at the point of submission.
- **Document upload.** Supporting documents captured at the point of request.
- **Routing across programs.** Requests route to the right internal department or tribal program automatically, with visibility for staff.

When a referral is needed

Every referral, clinical or social, is tracked from intake and consent through screening, routing, program action, follow-up and escalation, to resolution and documentation. Whether the referral goes to a clinic, a food bank, or a housing authority, it is tracked to a documented outcome. **That is what makes the loop closed.**

Built for How Tribal Health Programs Work

- **Sovereignty and data control.** Data belongs to the Tribe. WellCheck operates as a processor under tribal direction, with no external sharing without written tribal authorization. All data and records are available for export in standard formats at any time, deletion on request, U.S. data residency, and 42 CFR Part 2 segmentation for behavioral health and substance use records.
- **Multi-site, dispersed networks.** A single coordination backbone across clinics, CBOs, urban Indian organizations, food distribution sites, and rural service points, with real-time visibility for leadership.
- **Purchased/Referred Care (PRC).** EquiLoop's pre-screening and tracking map directly to the PRC workflow. Deferrals and denials are documented at the point they happen, producing a complete record of demand and disposition for budget and reporting purposes.
- **Federal and IHS reporting.** Disaggregated outcome data across clinical and non-clinical services, with equity analytics and exportable reporting packs that are structured, auditable, and funder-ready.

A note on fit

WellCheck aligns with Tribal health because it was built from real operational experience coordinating care across clinical and community services. It was built as general coordination infrastructure rather than around any single funding program, which is why it adapts to how a Tribe already operates rather than requiring the reverse.
